Charge collection for MIPs where obtained for a 1  $\mu\text{m}$  thick slice. Perpendicular hits where considered at the 9 points (A, B, ..., I) marked in the right picture.

Note that current and collected charge curves (versus time) are not shown for  $V_{\text{bias}} = -200 \text{ V}$ . Actually, this  $V_{\text{bias}}$  is very close to breakdown and those curves were found very critical!
